

---

# **Automating Prior Authorization**

**Presentation to the ONC HITAC Convergence of  
Administrative and Clinical Data Task Force**

**June 9, 2020**

- **Experience Automating Prior Authorization**
  - providers within their EHRs
  - payers in their utilization management systems
- **Lessons Learned**
- **Recommendations**

# Why Automate Prior Authorization?

## Patients

Less time spent waiting for approval

Reduces delays and interruptions in care

Improves patient satisfaction

## Providers

Streamlines workflow- fewer phone calls, faxes, portals

Reduced administrative costs

Reduced administrative and reporting burdens

## Payors

Improved provider satisfaction

Lower costs related to utilization management

Better consistency in adjudication decisions

# Overarching Prior Auth Issues and Challenges

**Labor-intensive source of administrative burden for providers and health plans**

**Unintended consequences for patients, plans and providers**

**Clinical and administrative workflow disruptions and inefficiencies**

**Clinician administrative and reporting burdens**

**Need for real time access to data within workflow and at point of care**

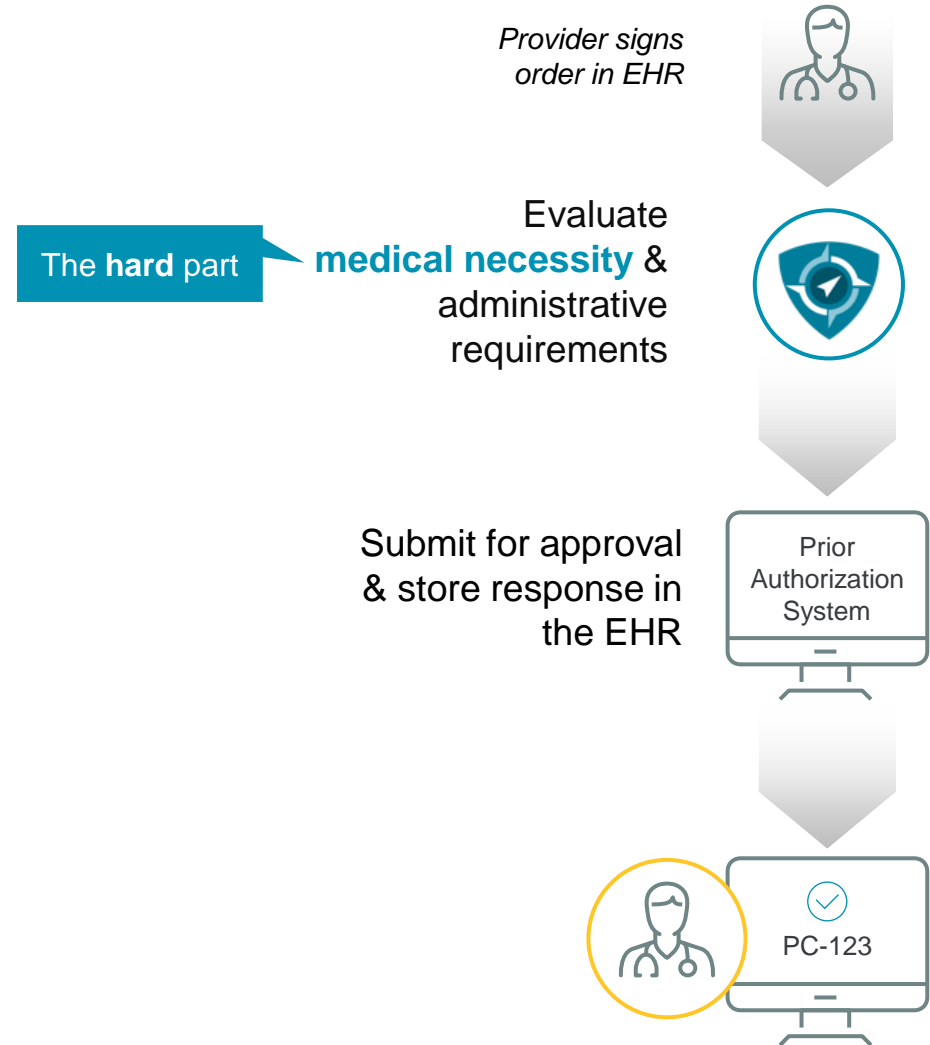

**Lack of standards adoption and implementation**

**Cumbersome and diverse PA requirements and processes**

**Lack of robust, end-to-end automation**

**Requires exchange and sharing of data among several stakeholders**

# Automated Prior Authorization Table Stakes

## No portals

- Must be embedded into provider workflow
- Must be triggered automatically
- Must be at the point of decision making

## No double documentation

- Must use what's already on the chart (both structured and free-text)

## No waiting

- Must be done in real time (both adjudication and approval)

## Probabilistic Model ("Black Box")

- Uses **statistical model**
- Requires training data of prior approvals
- Output: **likelihood** of approval

VS

## Deterministic Model ("Show Your Work")

- Uses **rules**
- Requires clinicians to build rules (decision trees)
- Output: **approval + provenance** (*i.e. exactly why the approval was made*)

## Guideline Codification is Complex and Time Consuming, but **Necessary**

### 70551 – MRI Brain (includes Internal Auditory Canal) TOC

CPT Codes:  
70551, 70552, 70553 – Brain MRI  
70540, 70542, 70543 · IAC

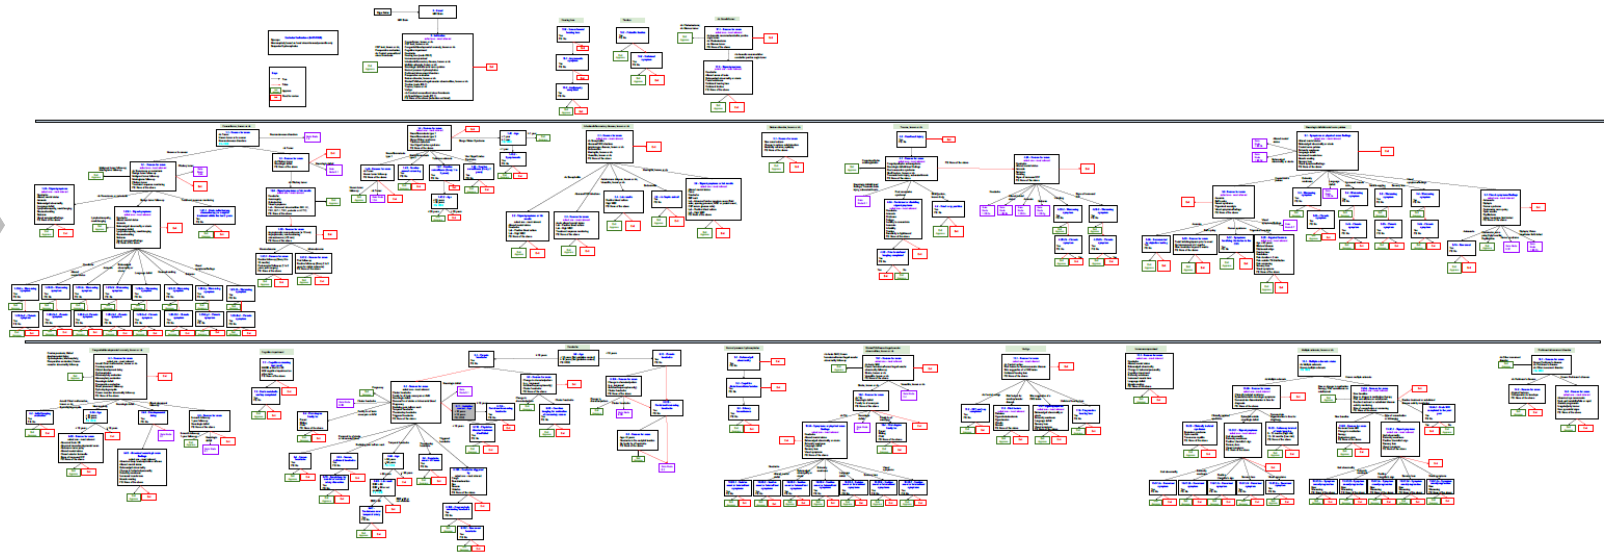

#### INDICATIONS FOR BRAIN MRI:

**For evaluation of suspected multiple sclerosis (MS):**  
(CMSC, 2018; Traboulsee, 2016; Thompson, 2017)

- For evaluation of patient with neurologic symptoms or deficits suspicious for MS with
  - A clinically isolated syndrome (optic neuritis, transverse myelitis or brain stem syndrome) OR
  - Recurrent episodes of variable neurological signs or symptoms not attributable to another cause
- To demonstrate dissemination in time for diagnosis (6-12 months for high risk, 12-24 months for low risk)

**For evaluation of known multiple sclerosis (MS):**  
(CMSC, 2018)

- To establish a new baseline (no recent imaging, postpartum, or 6-12 months after switching disease modifying therapy)
- Prior to starting or switching disease-modifying therapy

## Documentation patterns vary

- Data are often incomplete (e.g., outcomes are frequently missing), patient records are fragmented, data entry errors are common, & the timeliness or currency of the data can be difficult to establish<sup>1</sup>
- Providers' don't always document before signing orders

## Limited structured data

- In a recent survey of U.S. hospitals equipped with advanced EHRs, only about 35% of their clinical data was captured in structured format, & 65% in unstructured text<sup>1</sup>

"65 yo M pt with worsening LBP & sciatica since 5/1/2018. He has tried pt for 3 weeks. Reports no pain radiating to L hip. On Lisinopril/Benicar.

65 yo **AGE** M **FINDING** pt with **worsening STATE** LBP **FINDING** & sciatica **FINDING** since 5/1/2018 **TIMING** . he has tried pt **TREATMENT** for 3 weeks **TIMING** . reports no **STATUS** pain **FINDING** radiating to L **RELATIVESITE** hip **ANATOMICSITE** . on Lisinopril **MEDICATION** / Benicar **MEDICATION** .

## Fact Extraction Universe:

- 113K Symptoms / Diagnosis
- 43K Treatments
- 32K Anatomic Sites
- 28K Medications / Med Classes
- 14K Lab Tests
- 13K Diagnostic Tests
- 10K States:  
Progression, Severity, etc.
- 760 Relative Sites
- 660 Timings

## Fact Inference:

- 27 Problem List Diagnoses

**MRI, LUMBAR SPINE, W/O CONTRAST** is being evaluated for adherence to clinical guidelines.  
Please edit the clinical details for this order below.

WHY IS THIS NEEDED?

**Imaging indication** **Low back pain** ▼

**Symptom duration** **Acute LBP duration < 3 months** ▼

**Complicating feature** **Neurologic deficit, non-traumatic** ▼

**Neurologic deficit**

select one - most relevant

- Babinski/clonus
- Balance/gait abnormality
- Bladder/bowel dysfunction
- Hoffman's sign
- Hyperreflexia
- LE numbness/paresthesia
- LE weakness
- Saddle anesthesia
- UE and LE weakness
- None of the above

**Neurologic deficit duration** **Acute/new** ▼

**Contraindications to MRI**  Yes  No

CONTINUE

Integrate into provider workflow

Get patient data

Use of standards-based API and API certification criteria

Standardized set of health data classes and data elements and Standards Version Advancement Process

## Payors

- Amount of human interpretation involved in manual adjudication
- Duplicative guidelines, lack of clarity about which guidelines should apply
- Amount of similarity between guidelines from various sources  
*ex. 90%+ similar in some cases*
- Complications caused by assumptions inherent to existing PA process  
*ex. furnishing facility is known when the case is submitted for approval*

## Providers

- Variability in provider prior authorization management processes
- Lengths providers are willing to go in order to streamline prior authorization  
*ex. One health system maintains list of questions they've collected over time about what payors might want to know about*
- Unexpected data gaps  
*ex. missing payor info*
- EHR workflow limitations  
*ex. Scheduled vs. ordered procedures*

# Is Automating Prior Auth the End State?

Prior Auth is a means to an end – **managing appropriate utilization**. There is another way to do this: Clinical Decision Support (CDS)

CDS eliminates the admin hassle / expense related to prior auth

Paired with analytics, CDS still gives health systems a way to manage utilization, but at a lower cost

**Advance efforts to align and optimize existing and emerging standards and technologies**

**Address interoperability between administrative and clinical data and systems**

**Accelerate and expand development and adoption of open data and interoperability standards (APIs; CDS hooks; USCDI; FHIR)**

**Ensure providers and clinicians can connect and use any third-party applications of their choosing**

# Additional Recommendations

**Facilitate real-time data access for clinicians at point of care and within workflow**

**Harmonize requirements across agencies (CMS and ONC) and programs (HIPAA; CEHRT; PI)**

**Incentivize uses of health IT that reduce burdens and provide value to clinicians**

**Recognize nuances of PA (surgeries, tests, procedures, medications)**
